

Your only **non-invasive** option that provides relief from overuse injuries and painful conditions of the extremities.

"I am very happy with the results. I tried everything for my tennis elbow and failed. I was looking at having an operation, which I have now avoided."

– Y.L., patient

Controlled delivery of energy while cooling the surface for a more comfortable treatment

visit: www.relef.info

I dreaded traveling because my elbow hurt from carrying my luggage around. Just one month after my treatment I was able to haul my suitcase and even place it in the overhead bin without help.

– D.V., patient

Your doctor has been trained in RelēF Technology and can best advise you if this treatment is right for you.

Get Moving Again!

Get relief from pain associated with musculoskeletal conditions with the new RelēF Procedure

At last, a **non-invasive** option that works

Get Pain Relief!

Are you currently living with the pain, discomfort and limitation due to unhealed ligaments and tendons?

Have you been diagnosed with tennis elbow, golfer's elbow, tendonitis or a similar condition?

RelēF™ Technology can get you moving again with no recovery time or time off work.

Understanding Overuse Injuries

Overuse injuries often result from repetitive use of a specific body part such as knee, elbow or ankle over a period of time. The injury can come from activities that are life-related, work-related or even recreational.

The underlying cause of many overuse injuries is damaged collagen fibers from a lacking wound healing response. RelēF Technology is unique in that it non-invasively initiates your body's own wound healing response.

Compare Your Treatment Options

FDA-cleared RelēF Technology offers relief. Other non-invasive options fail to address the underlying condition. The RelēF mechanism of action is the induction of a wound healing response via electrocoagulation.

Frequently Asked Questions

What does non-invasive mean? RelēF Technology works directly through the skin. There are no needles or incisions and no surgery-related complications. No need to worry about infection, recovery time or time off work.

How does the RelēF Procedure work? RelēF Technology stimulates your body's own wound healing response by generating energy fields in deep tissues. At the same time, the top layers of the skin are cooled and protected.

Is the RelēF Procedure effective? Clinical studies report success rates in excess of 80%¹ and an even higher level of patient satisfaction.

Is RelēF Technology for everyone? RelēF Technology is not recommended for patients who have an implantable pacemaker or any other implantable electrical device.
